

Data Copilot: Client Onboarding Report

Generated 2026-08-31T08:16:30.779430+00:00

KPIs

Monetary figures are in Brazilian Real (BRL), the currency of the source dataset (Olist is a Brazilian e-commerce company). Data covers September 2016 to October 2018 (about 2 years), so totals are cumulative over that period, not annual. Average order value is the item price only, it does not include shipping.

Total Revenue	Average Order Value	Average Review Score
13591643.7	137.75	4.09
Total revenue is a key indicator of business performance, reflecting the overall sales generated.	Average order value helps assess customer spending behavior and can guide pricing strategies.	Average review score is crucial for assessing customer satisfaction and product quality.

Revenue by Product Category

Understanding revenue by product category helps identify top-performing categories and informs inventory and marketing strategies.

Orders by Payment Type

Analyzing orders by payment type reveals customer preferences and can inform payment processing strategies.

Top 10 Cities by Customer Count

Identifying top cities by customer count helps target marketing efforts and optimize logistics.

Business Insights

- The total revenue for the period stands at R\$13,591,643.70, indicating strong sales performance and overall business health.
- The average order value is R\$137.75, which suggests that customers are spending a reasonable amount per transaction; this insight can help in refining pricing strategies.
- The top product category is 'health_beauty' with R\$1,258,681.34 in revenue, highlighting a strong market demand that can guide inventory and marketing efforts.
- Credit card payments dominate with 76,505 orders, showing a clear customer preference that can inform payment processing strategies.
- The average review score is 4.09, reflecting a generally positive customer satisfaction level, although the high percentage of null values in review comments (88.34% for titles and 58.7% for messages) raises concerns about the quality of feedback collected, potentially limiting insights into customer experiences.
- The top city for customer count is São Paulo with 15,540 customers, indicating a key market area that may benefit from targeted marketing and logistics optimization.

What Else This Data Could Support

- Churn prediction could be implemented by analyzing customer purchase patterns and review scores to identify at-risk customers.
- Demand forecasting can be enhanced by utilizing historical sales data from order_items to predict future sales trends.
- Customer segmentation analysis could be performed based on purchasing behavior and demographics to tailor marketing strategies.

Technical details (data model, quality checks)

Data Quality Findings

- The geolocation table has 261831 duplicate rows, which may lead to inaccurate location-based analysis.
- The order_reviews table has a high percentage of null values in review_comment_title (88.34%), indicating potential issues with customer feedback collection.
- The order_reviews table also has a significant percentage of null values in review_comment_message (58.7%), which may limit qualitative insights from customer reviews.

Checks performed, table by table

Table	Rows	Columns checked	Duplicate rows
customers	99441	5	0
geolocation	1000163	5	261831
order_items	112650	7	0
order_payments	103886	5	0
order_reviews	99224	7	0
orders	99441	8	0
products	32951	9	0
sellers	3095	4	0
product_category_name_translation	71	2	0

Relationships confirmed between tables (checked by real matching values, not just column names):

- customers.customer_id → orders.customer_id (100.0% of values matched)
- order_items.order_id → orders.order_id (100.0% of values matched)
- order_items.product_id → products.product_id (100.0% of values matched)
- order_items.seller_id → sellers.seller_id (100.0% of values matched)
- order_payments.order_id → orders.order_id (100.0% of values matched)
- order_reviews.order_id → orders.order_id (100.0% of values matched)
- orders.customer_id → customers.customer_id (100.0% of values matched)

Recommended Data Model

Fact table: order_items

Dimensions: customers, products, sellers, order_payments, order_reviews

The order_items table serves as the central fact table as it contains transactional data related to each order, including product details and pricing. The dimension tables provide contextual information about customers, products, sellers, payment methods, and reviews, enabling comprehensive analysis of sales performance and customer behavior.
